

# Comprehensive Access and Governance for Hybrid Environments

Presented with

## Gain Simplified, Secure Access and Governance for Complex Environments

If your organization is like many, you're moving more and more applications to the cloud. But you still need to maintain critical applications on-premises. This type of hybrid enterprise environment is becoming the rule, not the exception.

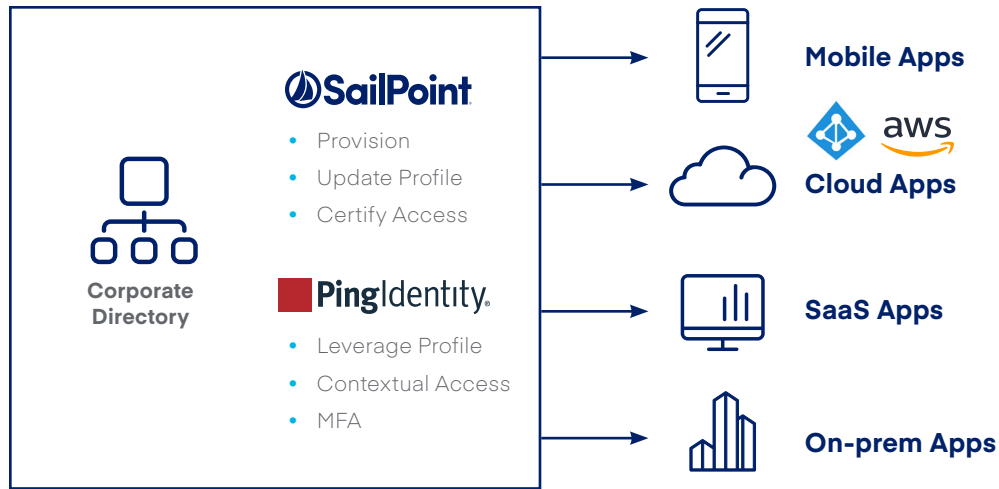

If this is your reality, you may feel challenged by the complexities of balancing security with user experience. On one hand, you must mitigate the risk of security breaches and meet increasingly regulated data security, consent and privacy compliance requirements. At the same time, you need to grant users secure access and govern that access, ensuring only the right people have access to the right applications.

The integration between SailPoint and the Ping Identity Platform provides a simplified access and identity governance solution to address the world's most sophisticated environments. Together, SailPoint and Ping help maintain a strong security posture, while ensuring your users, via their digital identities, gain secure and governed access to the applications they need, regardless of where they reside.

## How SailPoint and Ping Work Together

The integration of SailPoint + Ping enables organizations to provide access to applications in the public cloud, private cloud or on-premises, and gives them the peace of mind that the correct users are getting access to the applications and data they require. Now you can achieve a balance of security and convenience for your users, while demonstrating compliance and maintaining an access audit trail for every digital identity.

- SailPoint builds the user profile and empowers users with policy-based, self-service access to all applications, data and systems users need to do their jobs.
- The Ping Identity Platform authenticates these users from anywhere on any device, with a flexible identity solution that detects who that user is and what the appropriate access should be.
- Essentially, SailPoint creates a profile with all of the correct attributes and permissions. Then the Ping Identity Platform consumes that profile's attributes and permissions for a seamless user experience.

Built on open standards, the combined SailPoint and Ping solution creates a flexible, secure and scalable identity ecosystem. You're able to fortify your security posture without costly and time-sensitive integrations, plus you'll gain:

- **Increased Visibility:** View individual user access to ensure each login is securely authenticated and entitlements are appropriate for each user's current job/role.
- **Greater Governance & Control:** Gain greater control over access, plus increased efficiency through automation of processes like provisioning, password management, and access requests and certification.
- **Seamless & Secure Access:** Allow users to access applications with advanced authentication workflows that increases security using multi-factor authentication (MFA), reducing the work on IT to manage individual authentication per app.

The combination of SailPoint and Ping helps you fortify your security posture and be confident the right users have the right access. You're able to strike a balance between security and convenience for your users, while demonstrating compliance with confidence and ease, maintaining an access audit trail for every identity.
